
ParaPost® System

A complete range of posts for direct and indirect indications

COLTENE

Story

The Post Experts

In 1962, Coltene/Whaledent introduced ParaPost, the first standardized post system. ParaPost became a huge international success and today is the most widely used post in dentistry. Since its introduction, Coltene/Whaledent has been continuously improving the design and manufacture of post systems.

The ParaPost system offers a versatile range of fiber posts, metal posts and prefabricated casting post components for any clinical situation. Years of clinical data and studies attest to the safety, effectiveness and versatility of the ParaPost System.

- Global market leader in post systems
- Proven clinical success with > 500 studies
- More than 55 years of expertise
- One-office-visit and laboratory techniques
- Endo meets Resto – complete system with core-build-ups and cements

55
years of
confidence

ParaPost® – The System At A Glance

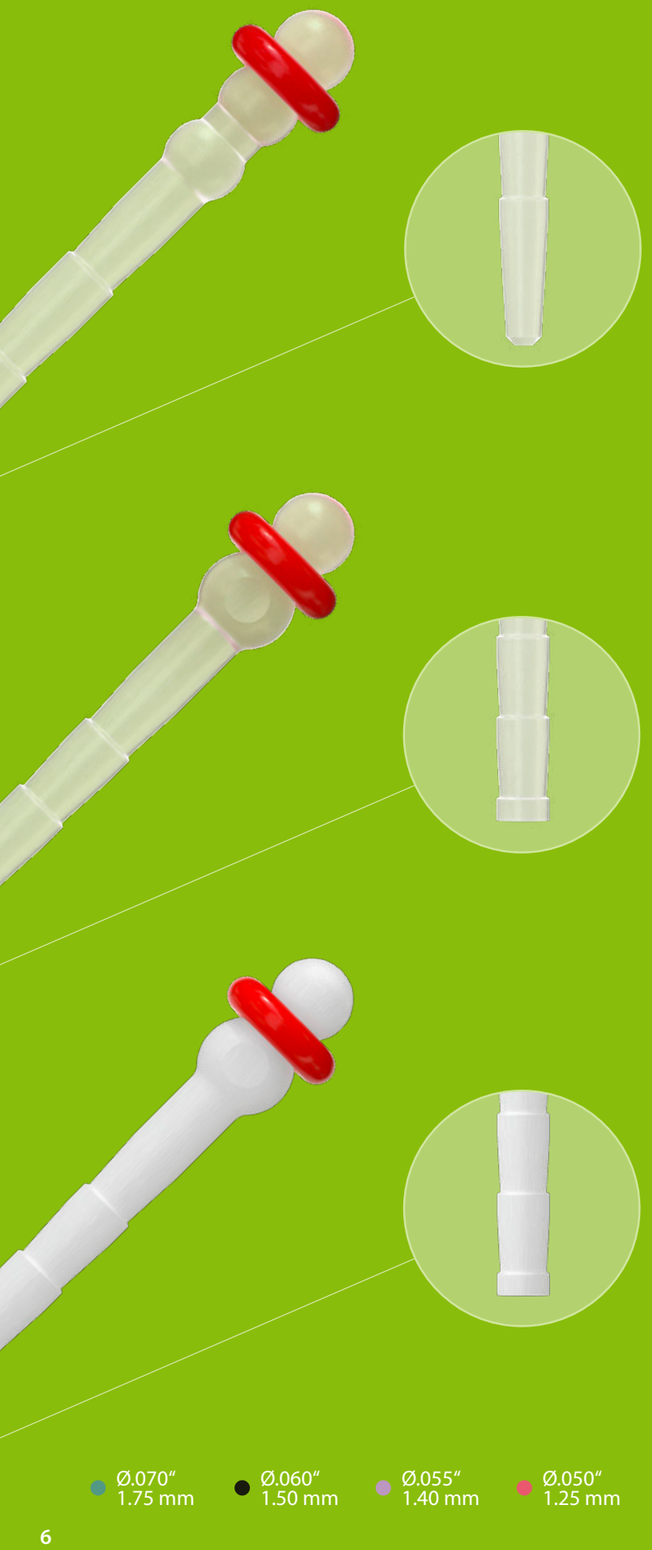
ParaPost® Fiber Posts



Taper Lux®

› Cylindro-conical post for narrow canals where protection of sound tooth structure is absolutely key

› 4 % tapered design provides a good apical fit with greater taper file technique

› Translucent, light-transmitting for fast on-command cementation

› Three head design for easy post length adjustment

› Rounded undercut head shape for optimal core retention

› Four sizes

Fiber Lux®

› Cylindrical post design ideal for universal post application

› Translucent, light-transmitting for fast on-command cementation

› Rounded, undercut double head design for optimal core retention

› Easy post length adjustment is on head and apical end possible

› Six sizes

Fiber White®

› Cylindrical post design ideal for universal post application

› Opaque fiber resin for masking discolored roots

› Rounded, undercut double head design for optimal core retention

› Easy post length adjustment is on head and apical end possible

› Five sizes

Ø.070“ 1.75 mm · Ø.060“ 1.50 mm · Ø.055“ 1.40 mm · Ø.050“ 1.25 mm · Ø.045“ 1.14 mm · Ø.040“ 1.00 mm · Ø.036“ 0.90 mm

ParaPost® Taper Lux®

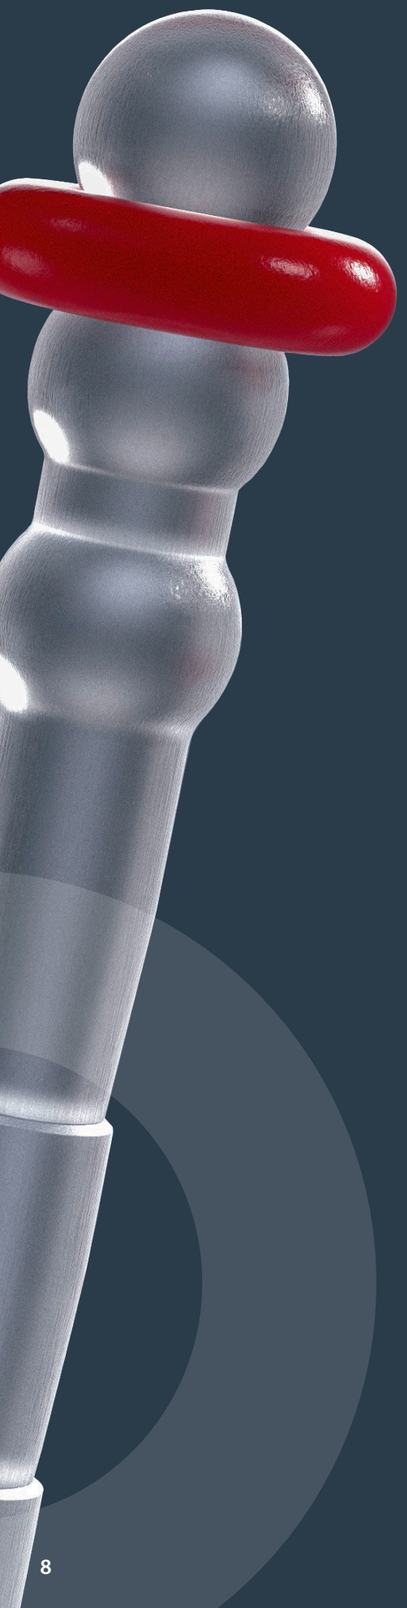
«ParaPost kit is one of the most organized kits on the market.»

«The posts come in a useful variety of sizes, and are radiopaque.»

«I love the taper design for narrow canals.»

DENTAL ADVISOR 2019 TOP AWARD WINNER

ParaPost® – Fiber Posts Benefits



Metal-Free Aesthetics

› All ParaPost Fiber Posts are ideal for highly aesthetic, metal-free restorations within their individual characteristics

› Fiber Posts are made of translucent or opaque fiber resin materials that reflect the natural hues of the tooth and eliminates shadows through all-ceramic crowns or composite restorations at the gingival/crown interface.

› Its elasticity performance rivals that of dentin – less risk of fracture of the root since loading is more evenly distributed

› Less brittle than ceramic root posts

Superior Head Design

› Rounded, undercut multihead designs minimizes stress in the core material due to polymerization shrinkage

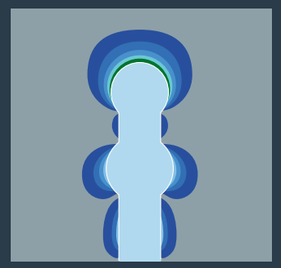
› Multi-head designs for easy post length adjustment

› Multi undercuts help to increase mechanical retention of the core material

› Antirotation surfaces stabilize the adapted core build-up

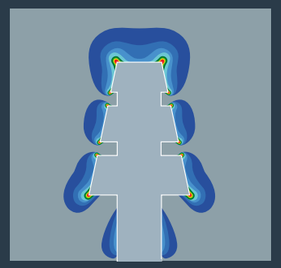
Using computer analysis and imaging*, areas of stress concentrations can be predicted. Red indicates areas of greatest stress.

ParaPost® Fiber Lux®/Fiber White®



The rounded head design of the Fiber Lux and Fiber White reduce stresses in the core material and thereby prevent micro-fractures

Other Posts



Posts that have heads with sharp edges or angles create stress points in the core material that can lead to micro-fractures

Fast On-Command Cementation

› The translucent, light – transmitting fiber resin material of ParaPost Taper Lux and Fiber Lux allows the use of light-curing cements and core material.

› Greater control over cement set time

› Free choice between dual-or self curing resin cements

*** Finite Element Analysis by SAS Ingenieurbüro AG, Switzerland**

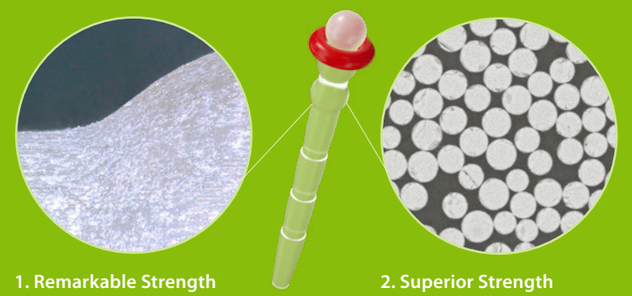
Superior Strength

› High percentage of unidirectional fiber clusters gives excellent strength characteristics, without compromising flexibility

› Retention ledges increase mechanical retention

› Cylindrical post design evenly distribute functional forces and eliminating the wedging effect of tapered posts

Uniformly unidirectional fibre clusters strengthen the post structure without compromising flexibility.



1. Remarkable Strength

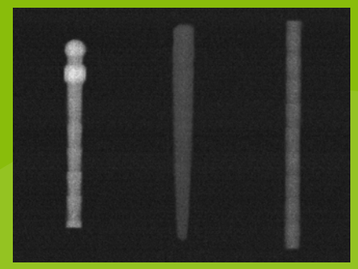
Fiber Lux – 400 × enlargement

2. Superior Strength

A scanning electron microscope image shows a cross-section of a Fiber Lux post

Excellent Radiopacity

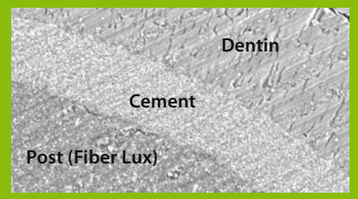
Radiograph of Fiber Lux, and two other fiber posts.



The radiopacity of ParaPost Taper Lux and Fiber Lux allows the posts to be seen clearly on a radiograph

Outstanding Monobloc Restoration

ParaPost Fiber Posts are made for the use of resin based cement and core build-up materials (e.g. ParaCore) to provide an optimal «monoblock» between the dentin-post-crown, resulting in one cohesive restoration with outstanding durability and strength



Extraordinary Bonding

Fiber Lux – 140 × enlargement

Fiber Lux undergoes a chemical bond with self- and dual-curing cements and all core materials with a composite base. This ensures a homogeneous restoration.

ParaPost® Fiber Post – Clinical Application

Preoperative clinical situation right lateral incisor #12 after root canal treatment with provisional sealing

Removal of provisional sealing

Removing Gutta Percha

Extending the post preparation with a ParaPost bur

Trialseating of ParaPost Fiber White to check length and fit

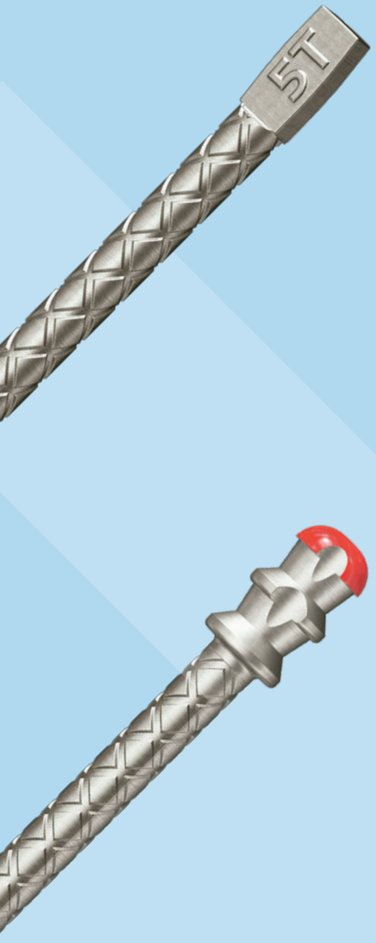
Applying One Coat 7 Universal into rootcanal and tooth surface for 20 sec. Afterwards removal of excess bond with a gentle flow of air and a paper point

Freehand core build-up using ParaCore automix

The finished core – ready for the impression

Situation 3 days postop

ParaPost® X-System Metal Posts



XP™ Post

› Cylindrical post with flat head is ideal for the treatment of slim or of multi-rooted teeth

› X-Shape retention pattern including cement venting for superior mechanical grip

› Available in Titanium alloy (Ti6AL4V) and stainless steel

› Seven sizes ● ● ● ● ● ● ●, all compatible with ParaPost Drills

XH™ Head

› Cylindrical post for easy core build-up application

› Rounded, undercut double head design for optimal core retention

› Flat shoulder stop provides security against over – insertion and apical stress

› X-Shape retention pattern including cement venting for superior mechanical grip

› Seven sizes ● ● ● ● ● ● ●, all compatible with ParaPost Drills

XT™ Thread

› Threaded post with X-Shape retention pattern – cylindrical – where very high mechanical grip is required

› Patented, low-profile threads cut through dentin with minimal insertional stress

› Threads are located only in the coronal area where root canal walls are thicker

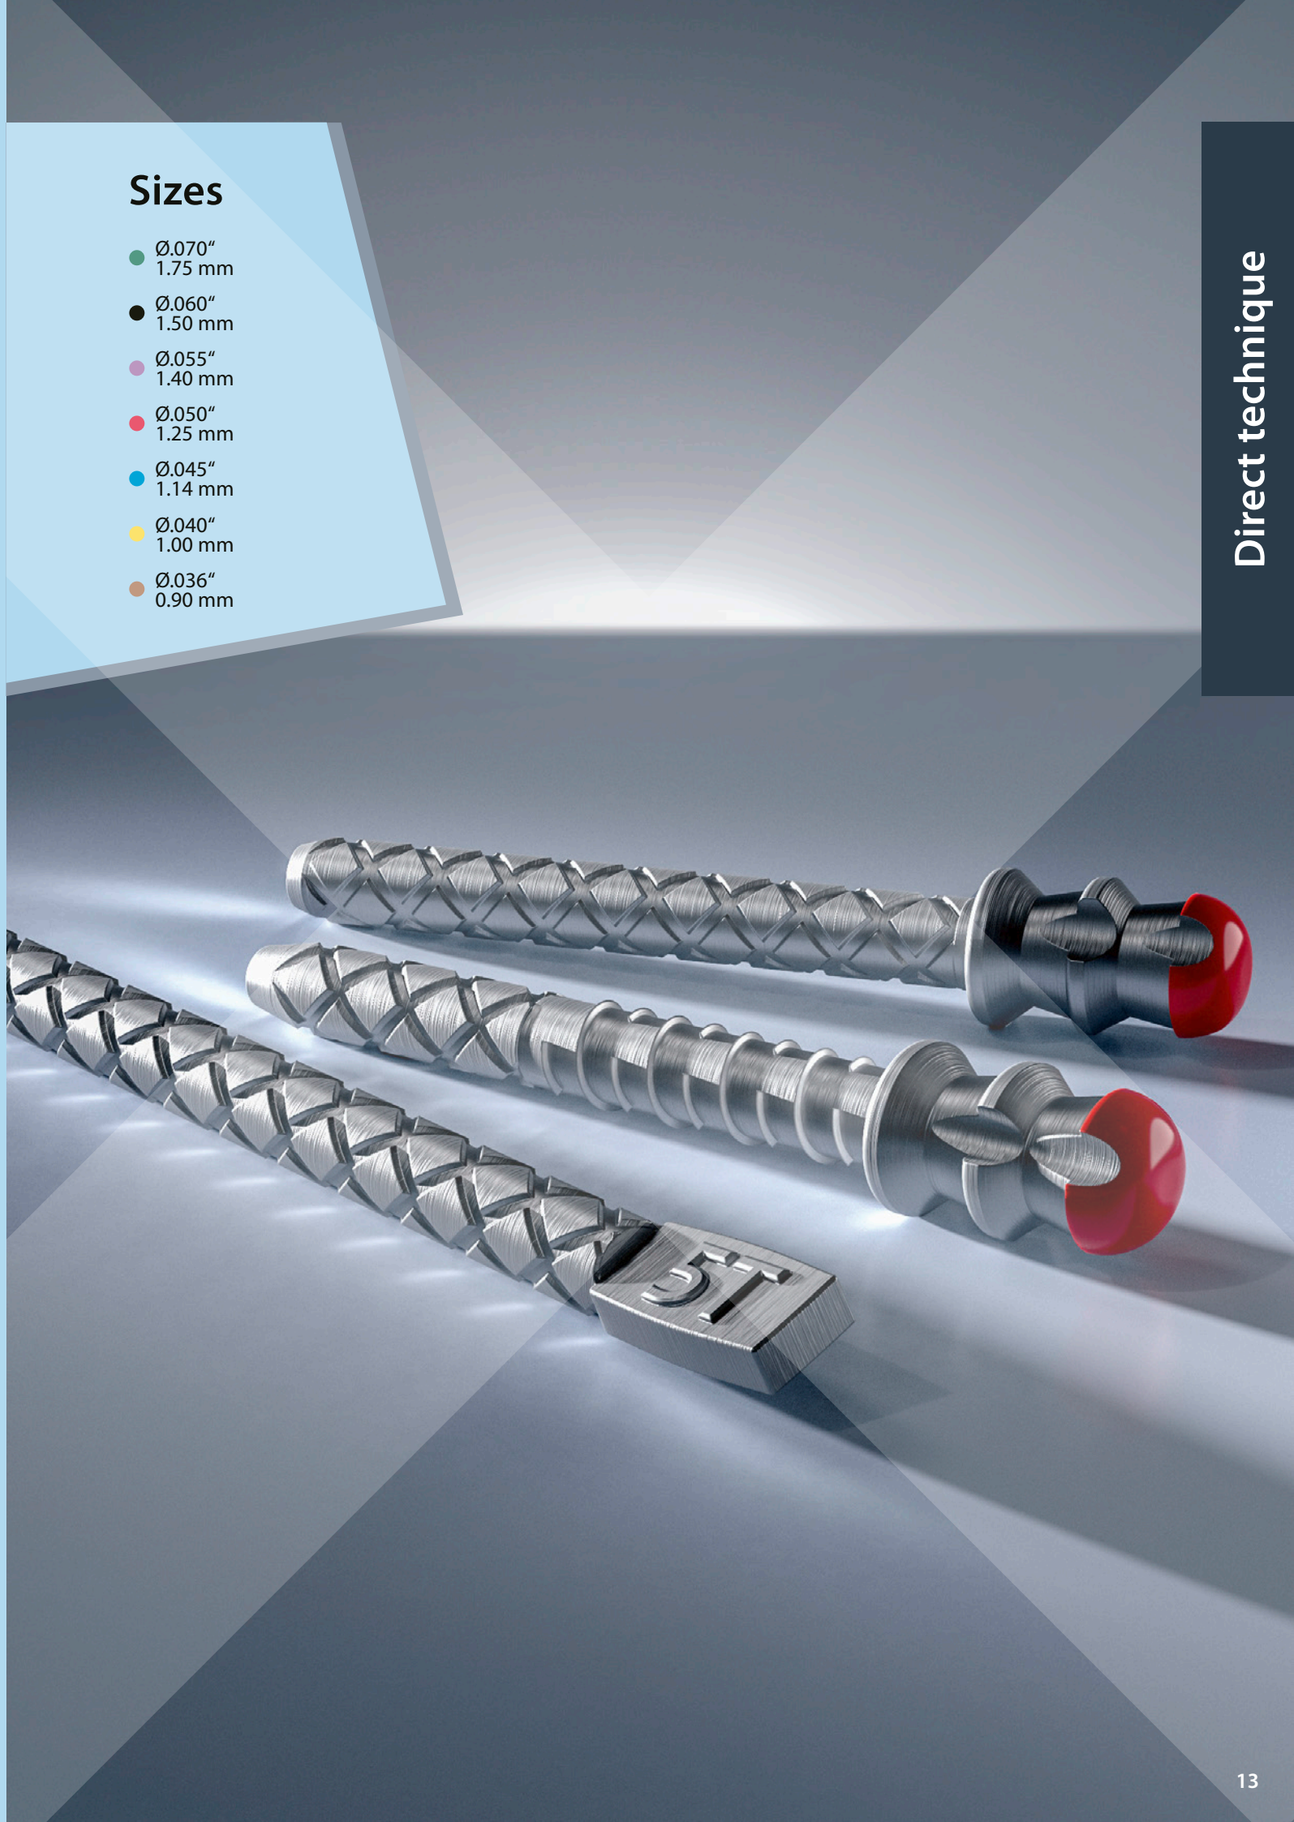
› Rounded, undercut double head design for optimal core retention

› Flat shoulder stop provides security against over – insertion and apical stress

› Six sizes ● ● ● ● ● ●, all compatible with ParaPost Drills

Sizes

- Ø.070“ 1.75 mm
- Ø.060“ 1.50 mm
- Ø.055“ 1.40 mm
- Ø.050“ 1.25 mm
- Ø.045“ 1.14 mm
- Ø.040“ 1.00 mm
- Ø.036“ 0.90 mm



ParaPost® X-System Metal – Benefits

Complete Endodontic Post System For All Indications

› State-of-the-art universal endodontic post system for all direct and casting techniques
› Standardized system with up to seven sizes
› Non-end cutting, depth-calibrated drills for precise canal preparation
› Two- or three-fluted drills available

Patented, X-Shape Retention Pattern Provides

› Resistance to rotation
› Superior tensile retention
› Excellent cement venting
› Parallel sides distribute functional stress equally along the entire length of the post

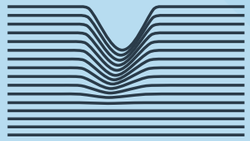
Special Manufacturing Technique Provides

› Increased resistance to oblique forces
› Chamfered for ease of insertion during cementation

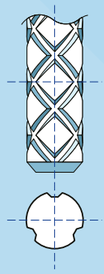
What Makes ParaPost®X™ Posts So Resistant To Oblique Forces?

It's the combination of a unique manufacturing technique and retention pattern

X-Shape Manufacturing
Retention pattern is made by a special cold-forming process which produces an uninterrupted fibrous grain structure in the alloy, increasing the post resistance to oblique forces.

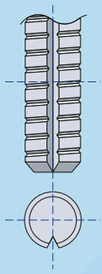


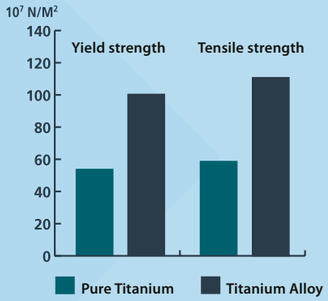
X-Shape Retention Pattern
The retention pattern has a larger cross-sectional area at any point along the entire post length, providing greater resistance to oblique forces.



Traditional Manufacturing
Traditional machined retention patterns produce an interrupted grain structure in the alloy, reducing the post resistance to oblique forces.

Traditional Retention Pattern
Traditional circular retention patterns have a smaller cross-sectional area at each groove, which concentrates oblique forces toward the inner areas, reducing the post resistance to oblique forces.

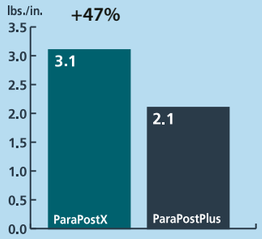




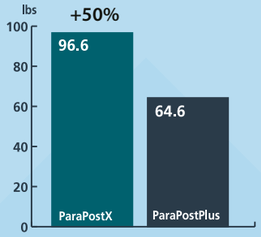
Titanium Alloy

ParaPost X Posts are made from Ti6AL4V titanium alloy which is twice as strong as pure titanium. Ti6AL4V is used for high stress-bearing implant parts (ie., hip joints, dental abutment retaining screws).

Resistance to Rotation[1]



Tensile Retention[1]



Resistance to Oblique Forces[1]

ParaPost® X-System – Casting Technique

XP™ Impression Post

› Cylindrical, rigid polymer post for precise and time saving impression taking

› Impression of entire length of post space without undercuts

› Seven sizes ● ● ● ● ● ● ●, all compatible with ParaPost Drills

XP™ Burnout Post

› Cylindrical, rigid polymer post for precise casting of a one piece cast post/core

› Provides an X-Shape retention pattern for superior mechanical grip and cement venting

› Easy replication of the entire length of the post space

› Stabilizes the wax core build-up during removal

› Individual choice of alloy

› Seven sizes ● ● ● ● ● ● ●, all compatible with ParaPost Drills

XP™ Temporary Post

› Cylindrical, plain titanium post for secure retention of temporary crown

› Preserves the diameter of the canal preparation

› Friction grip for snug placement, eliminating the need for temporary cement in the canal

› Avoids time consuming removal of temporary cement from post space

› Seven sizes ● ● ● ● ● ● ●, all compatible with ParaPost Drills

● Ø.070“ 1.75 mm ● Ø.060“ 1.50 mm ● Ø.055“ 1.40 mm ● Ø.050“ 1.25 mm ● Ø.045“ 1.14 mm ● Ø.040“ 1.00 mm ● Ø.036“ 0.90 mm

Prefabricated casting components for the direct/ indirect casting technique

ParaPost® X-System – Casting Technique – Benefits

Indirect technique

- Passive cemented, cylindrical, prefabricated casting components for the direct/indirect casting technique. Ideal for clinical situations requiring the additional strength of a precise, one-piece cast post/core and choice of alloy.
- Provides an X-Shape retention pattern for superior mechanical grip and cement venting Parallel-sided castings evenly distribute functional stress while eliminating the wedging effect of tapered cast posts.
- All system components are color-coded to the drills
- Chamfered for easy insertion.

ParaPost® Drills

Initial Drill

- Cutting drill to define drill depth
- Two-fluted, very good cutting efficiency
- Laser marks at 7, 9 and 11 mm for drilling depth determination
- For fiber post removal

ParaPost® X-System Drills

- Cylindrical, Standard drills
- Two-fluted, very good cutting efficiency
- Laser marks at 7, 9 and 11 mm for drilling depth determination
- Seven sizes

ParaPost® XT™ Drills

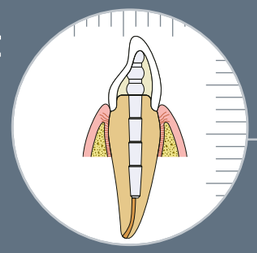
- Cylindrical, Premium drills
- Three-fluted, reduced vibration and higher durability
- Laser marks at 7, 9 and 11 mm for drilling depth determination
- Six sizes

ParaPost® Taper Lux® Drills

- Cylindro-conical, drills only compatible for ParaPost Taper Lux Posts
- Two-fluted, very good cutting efficiency
- Laser marks at 7, 9 and 11 mm for drilling depth determination
- Four sizes

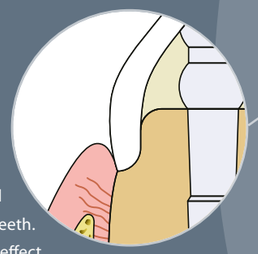
Hints And Tips
For A Successful Post Preparation

Crown / Root / Post Proportions



1. Selected Post diameter shall not be larger than 1/3 of root diameter
2. Post length in the root should be as long as the height of the crown
3. Post length should be at least ½ of root length
4. 1/3 of post length should be located in the coronal area and 2/3 in the root
5. Apical stop shall be at a least 4 mm

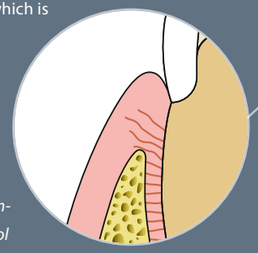
Ferrule Effect



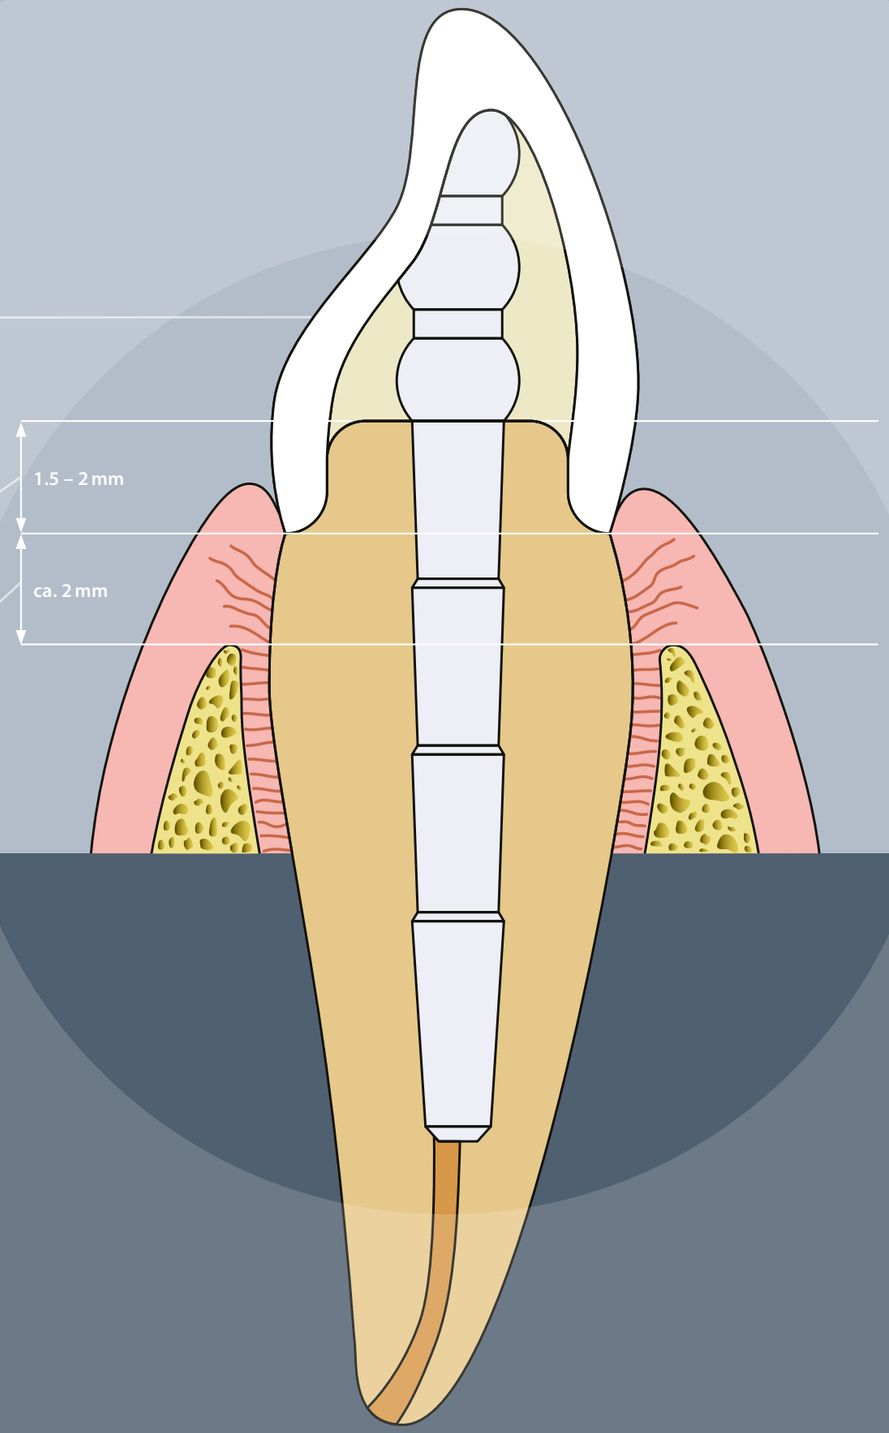
Preserving sound coronal and radicular tooth structure to create a ferrule effect is crucial for the optimal biomechanical behavior of restored teeth. 1.5- to 2-mm of ferrule has a positive effect on fracture resistance. Residual dentinal walls are expected to be at least 1mm thick. An incomplete ferrule is considered to be a better option than a complete lack of ferrule.
In teeth with no coronal structure orthodontic extrusion should be considered rather than surgical crown lengthening

Biologic Width

The biologic width is the distance from the depth of the gingival sulcus to the crest of the bone (average 2.04 mm*). Biologic width is inviolable to protect periodontal health, which is one of the keys for tooth and dental restoration longevity. This distance can be corrected with crown lengthening: surgical osteotomy, gingivectomy or orthodontic extrusion.



** Schmidt JC, Sahrmann P, Weiger R, Schmidlin PR, Walter C. Biologic width dimensions – a systematic review. J Clin Periodontol 2013; doi: 10.1111/jcpe.12078.*



One System – Core Build-Up And Cementation

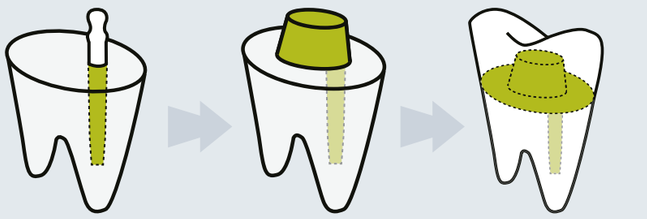
ParaCore

Dual-cured, glass-reinforced composite for post cementing, core build-ups and crown & bridge cementation.

3 Indications – 1 Material
3 Colors – 2 Timings – 1 Material
ParaCore simplifies the post and core restorative technique with its ability to be used as a 3-in-1 material for post cementation, core build-ups and crown & bridge cementation.
ParaCore can also be used to cement inlays and onlays.
Using one material for cementation and core build-ups provides an optimal «monoblock bond interface» between the dentin-post-crown, resulting in one cohesive restoration with outstanding durability and strength.

For more information download the prospekt on www.coltene.com

Indications



Post cementing | Core build-up | Cementing of restoration

SoloCem

Secure cementing does not depend on the number of working steps. Self-adhesive SoloCem achieves reliable values – with no additional bonding.

This is the result of monomers contained and the composite-like formulation. The convenient automix syringe and the ready-to-use mixing tips offer a simple and time-saving application of SoloCem. Easy to use and time saving high bonding strengths without additional adhesive low shrinkage antibacterial zinc oxide high radiopacity.

For more information download the prospekt on www.coltene.com

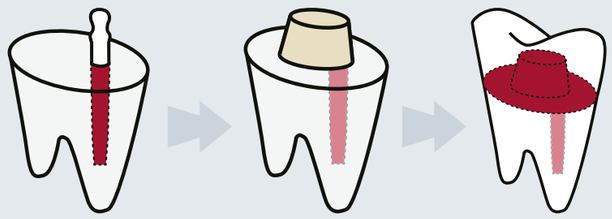
Easy and fast application
SoloCem saves you time without having to forego reliable bonding. MDP and 4-MET(A) monomers ensure good bonding values on a
range of different materials without requiring a separate adhesive. This simplified form of application reduces the risk of potential error sources which could affect the bond and thus the quality of the entire restoration.

- **self-adhesive properties**
- **fluorescent**
- **Automix syringe and ready-to-use mixing tips**
- **Intraoral processing time of approx. 60 seconds**
- **easy removal of excess material (after light curing for 3 s)**

Indications
The easy handling of SoloCem offers advantages in a number of indications. You can count on the self-adhesive properties of SoloCem for the permanent cementation of:

- crowns (ceramic, metal, composite)
- bridges (ceramic, metal, composite)
- inlays (ceramic, metal, composite)
- onlays (ceramic, metal, composite)
- all types of endodontic posts
- implant abutments (zirconium oxide and titanium)

Indications



Post cementing | For core build-up use a resin based core build-up material | Cementing of restoration
